## 1. Introduction

The EMEP Centre on Emission Inventories and Projections (CEIP) operates the UNECE/EMEP emission database (WebDab) which contains information on air pollutant emissions and projections from the Parties to the Convention on Long-Range Transboundary Air Pollution (LRTAP) (UNECE 1979). Furthermore, emissions used in EMEP models (gap-filled emissions) and gridded emissions in Google maps are synthesized and made available on the CEIP website ([www.ceip.at](http://www.ceip.at), CEIP 2020).

Data processed by CEIP were reported by the Parties to the LRTAP Convention as sectoral emissions (NFR14) and National Total emissions according to the UNECE guidelines for reporting emissions and projections data under the LRTAP Convention, Annex I (UNECE 2014). For gap-filling and gridding by CEIP, the NFR14 sector data are aggregated to 13 GNFR sectors. In several cases, no data were submitted by the countries, or the reporting is not complete or contains errors. Before these emission data can be used by modelers, missing/erroneous information have to be filled in/replaced. To gap-fill/replace emissions data, CEIP applies a systematic quality control and gap-filling routine. After gap-filling is complete, the territorial sector emissions are then mapped spatially using the EMEP grid system.

This documentation describes how the reported emissions of main pollutants (NO<sub>x</sub>, NMVOCs, SO<sub>x</sub>, NH<sub>3</sub>, and CO), particulate matter (PM<sub>2.5</sub>, PM<sub>10</sub> and PM<sub>coarse</sub>) and black carbon (BC) are subject to a central quality control and, where necessary, how these data are gap-filled/replaced. The document also explains how emissions from other regions in the EMEP domain, which are not obliged to report emissions data, are incorporated. This year CEIP has updated and streamlined procedures. The reasons for undertaking this step were: 1) the need to incorporate new independent estimates; and 2) the ever-increasing number of years for which the reported data need to be evaluated and processed.

## 2. Summary of the of the quality control and gap-filling process

The first step is to collect and synthesize the official submissions by the Parties to the LRTAP Convention. All submissions received **up to 17<sup>th</sup> April 2020** were used as a basis for the gap-filled data set. Parties report their emissions inventories to the LRTAP Convention as sectoral emissions (NFR14) and National Total emissions according to the UNECE guidelines for reporting emissions and projections data under the LRTAP Convention, Annex I (UNECE 2014). The reported NFR sector emissions are then aggregated to the 13 GNFR sectors used for the gridding procedure (A cross-walk between the NFR and aggregated GNFR sectors is provided in Annex II, Table A 2):

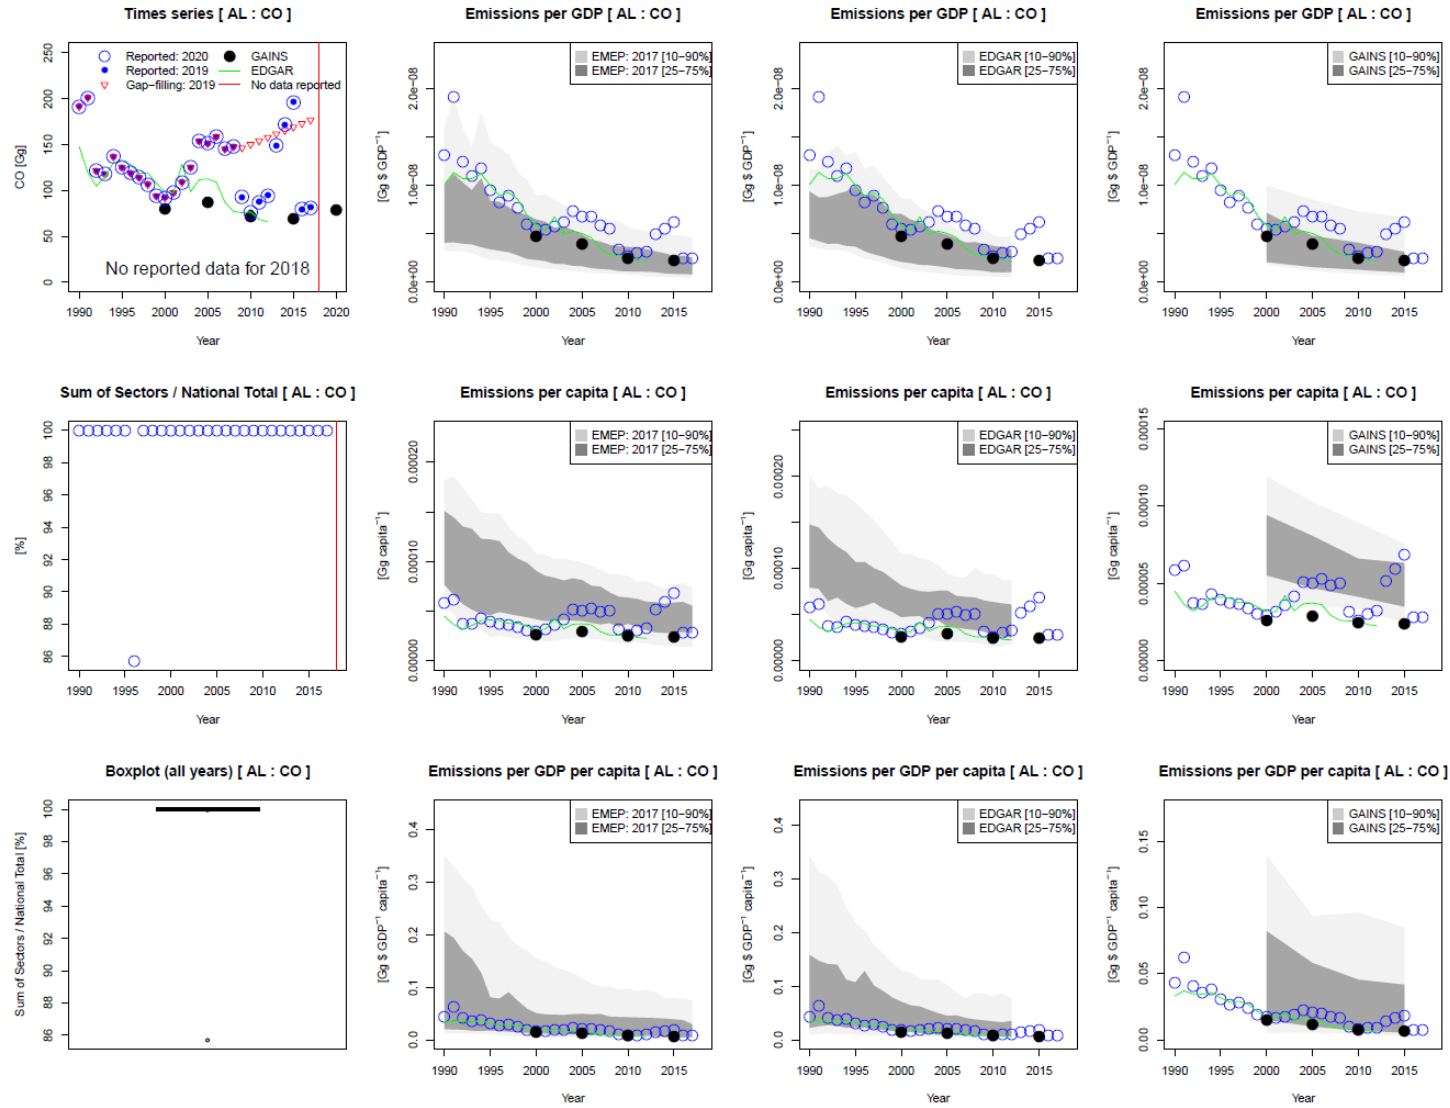

1. A\_PublicPower
2. B\_Industry
3. C\_OtherStationaryComb
4. D\_Fugitive
5. E\_Solvents
6. F\_RoadTransport
7. G\_Shipping
8. H\_Aviation
9. I\_Offroad
10. J\_Waste
11. K\_AgriLivestock
12. L\_AgriOther
13. M\_Other

The dataset of reported emissions is then checked to ascertain where data are missing and to evaluate the plausibility of those emissions estimates which are reported. To do this a routine, coded in the open source statistical programming environment, R<sup>1</sup>, retrieves the current dataset of reported emissions and processes these data with other datasets (previously reported and gap-filled EMEP datasets, independent emissions datasets and data on economic indices). For each pollutant of each country, quality control graphs are generated, with which assigned experts can evaluate the plausibility of the reported emissions.

a)

b)

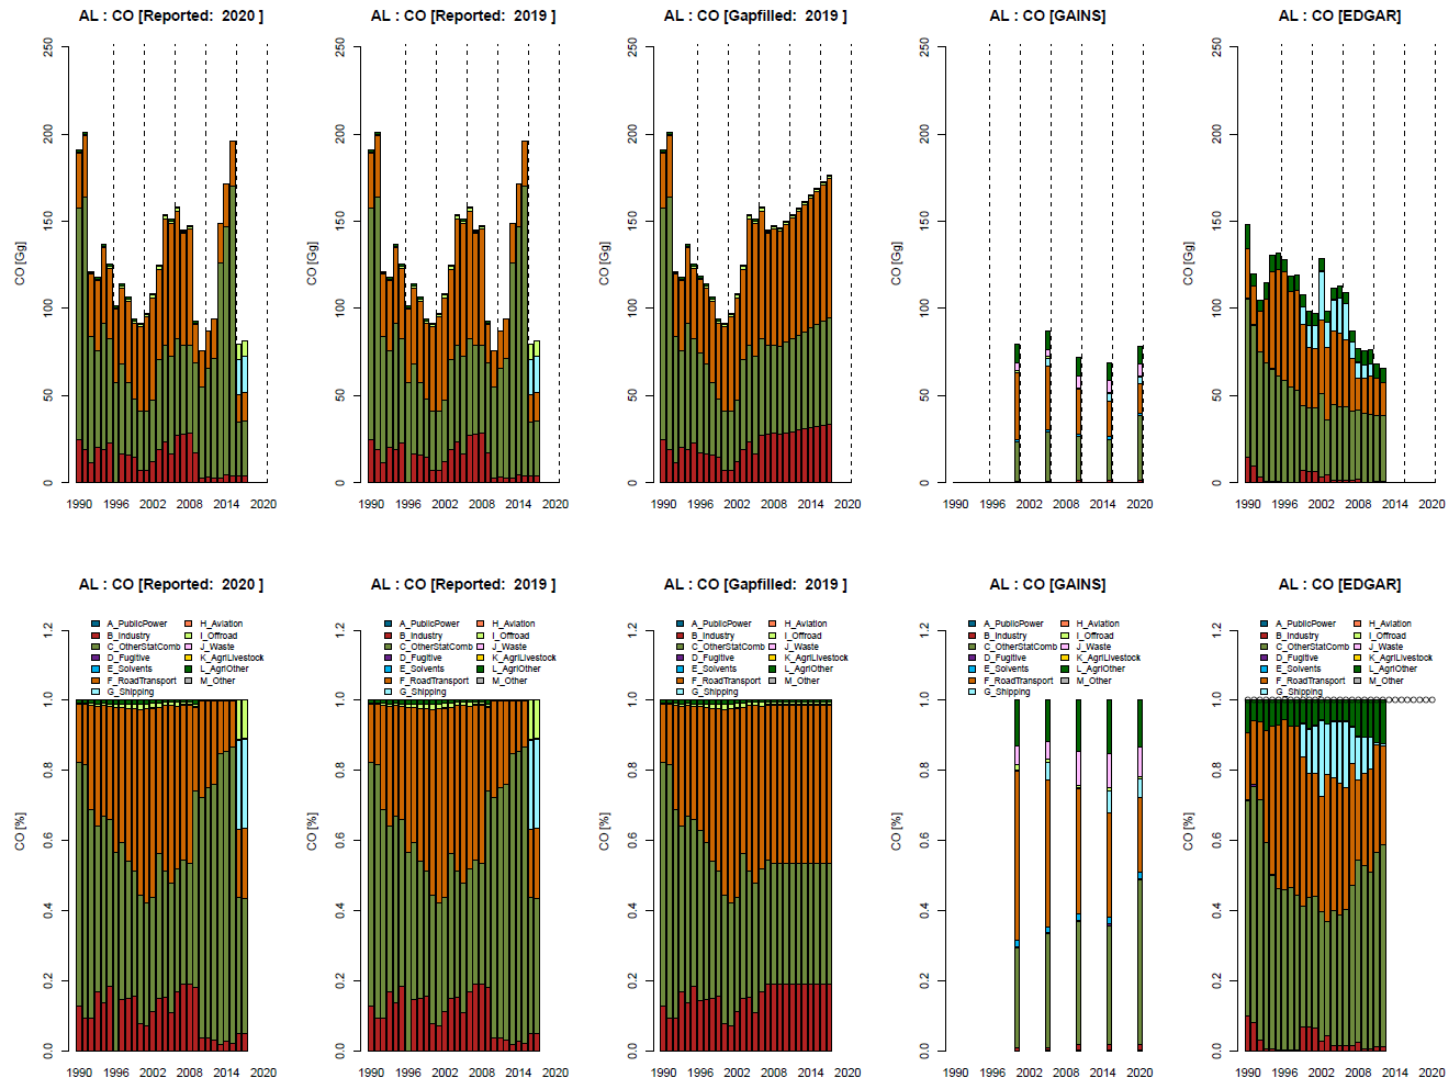

Figure 1: Quality control graphs for evaluating the plausibility of Albania's reported CO emissions both at the national total (above) and GNFR sector level.

As the example for Albania’s CO emissions (Figure 1a) demonstrates, the time series of the reported national totals are compared against the same emissions reported in the previous year, as well as the time series contained within the gap-filled EMEP dataset of the previous year. For comparison, respective national totals from independent sources are also plotted. The independent datasets used are the v4.3.2 EDGAR dataset<sup>2</sup> (1970-2012, Crippa et al. (2018)) and the latest v6b ECLIPSE dataset<sup>3</sup> (2000, 2005, 2010, 2015 and 2020 projection) from the Greenhouse gas – Air pollution Interactions and Synergies model, GAINS (Amann et al., 2011). Note that the v6b ECLIPSE dataset is an advanced version of the soon to be published dataset that was kindly provided to CEIP by IIASA. Below this graph of the time series of national total emissions, a scatterplot and boxplot illustrate whether the sum of sector emissions added up to the reported national totals. Finally, the national total time series is normalized against economic statistics from the World Bank<sup>4</sup> and plotted against respective ranges as calculated from the previously gap-filled EMEP dataset and from the EDGAR and GAINS datasets.

In addition to these graphs at the national total level, corresponding quality control graphs are generated to evaluate the reported sectoral emissions. As Figure 1b demonstrates, the sectoral emissions and relative distributions are compared against those reported and gap-filled in the previous year and against respective values from the EDGAR and GAINS datasets.

Such graphs are generated for all the main pollutants, as well as for PM<sub>2.5</sub>, PM<sub>10</sub> and BC. However, for the particulate emissions, additional mass balance assessment graphs are also generated (Figure 2).

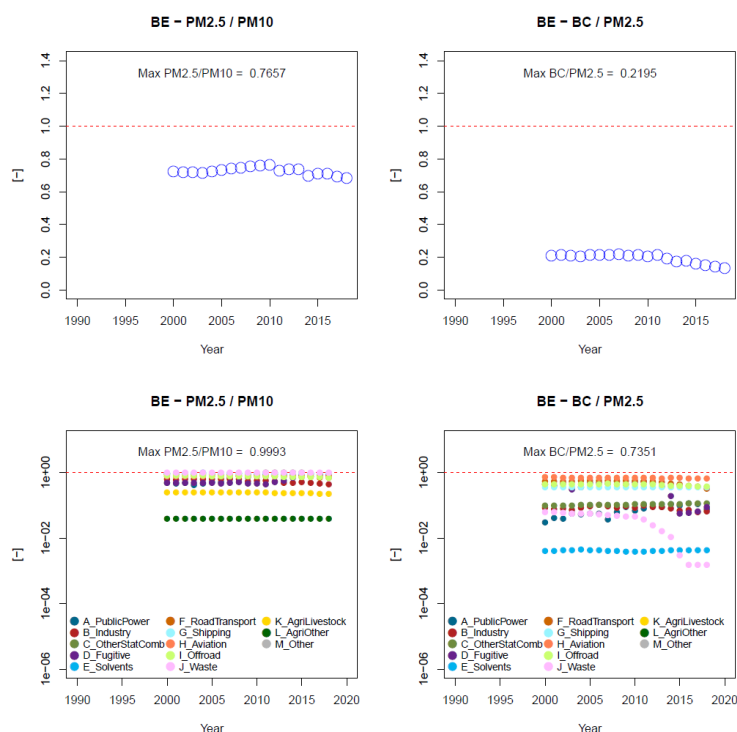

Figure 2: Mass balance evaluation of Belgium’s particulate matter emissions (PM<sub>2.5</sub>, PM<sub>10</sub> and BC)

<sup>2</sup> [https://edgar.jrc.ec.europa.eu/overview.php?v=432\\_AP](https://edgar.jrc.ec.europa.eu/overview.php?v=432_AP)

<sup>4</sup> <http://datatopics.worldbank.org/world-development-indicators/>

Based on the generated quality control graphs, CEIP experts check for where data are missing and importantly whether the reported emissions are plausible. Where data from 2000 onwards are missing and/or implausible, CEIP experts must select the most appropriate gap-filling/replacement option from a set of predefined methods:

- *Replacement* – where no data are available or no plausible data are available, the most appropriate option is to replace the time series with the respective estimates from the interpolated GAINS ECLIPSE v6b dataset. This option can be applied to either all GNFR sectors (Figure 3) or in certain cases to a single GNFR sector (Figure 4).

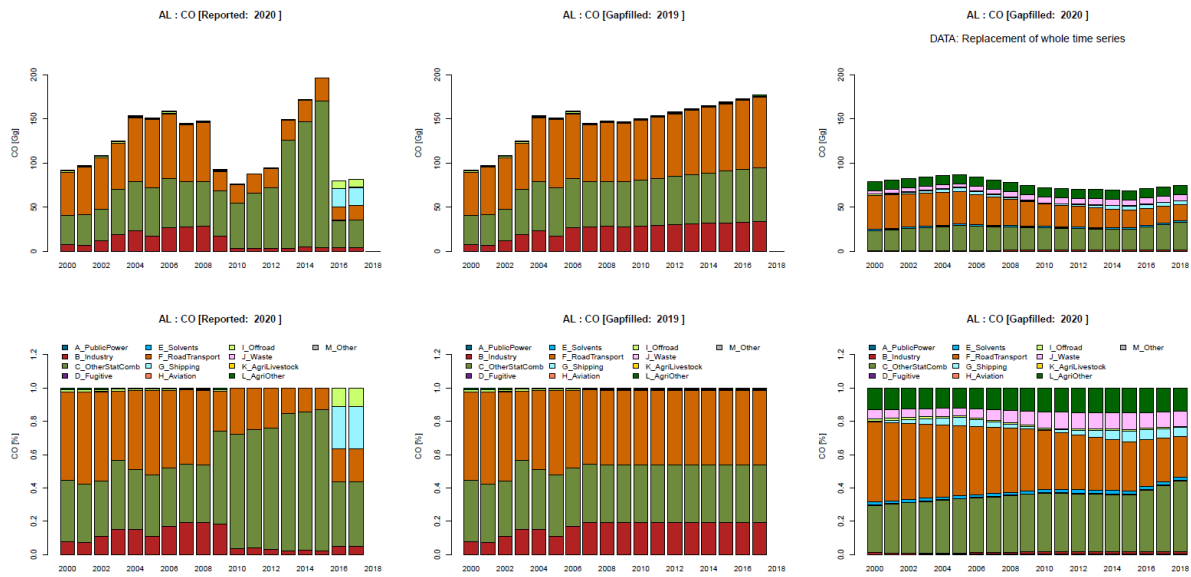

Figure 3: Example of Replacement of all sectors (Albania, CO)

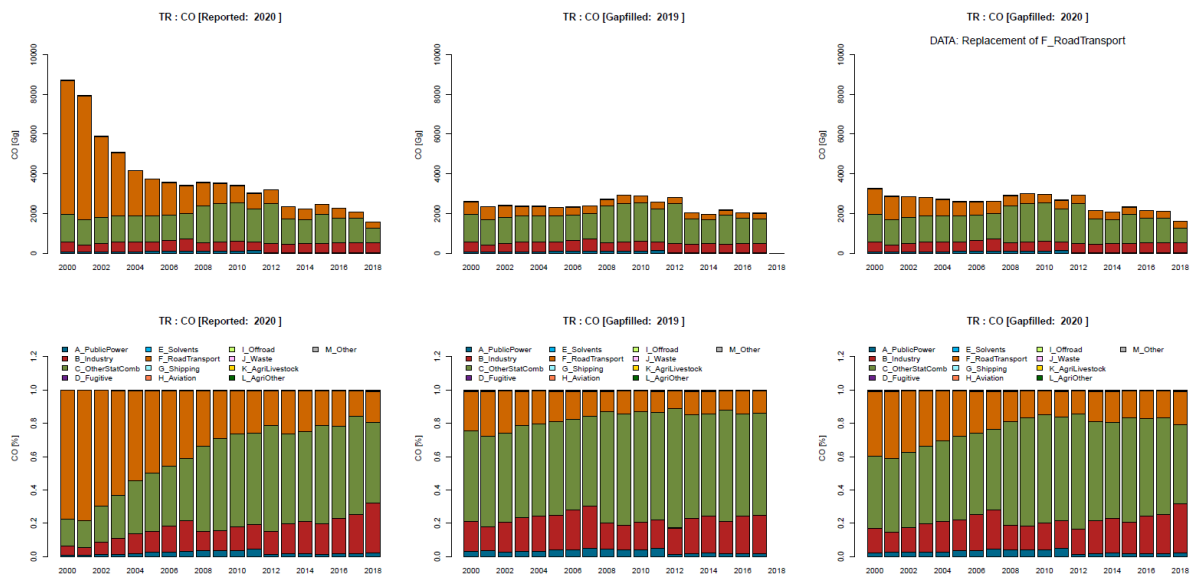

Figure 4: Example of Replacement of a single sector (Turkey, CO)

- *Extrapolation* - where a significant portion of the data appears plausible, it is appropriate to extrapolate the missing/implausible years at the beginning and/or end of the time series. In this case the expert must decide the trend with which to extrapolate the national total:

- Constant emissions are assumed (Figure 5); or where several years need to be extrapolated...
- Using the respective trends from GAINS estimates or even reported national totals (where national totals seem plausible) (Figure 6)

Unlike *Replacement*, this option can only be applied to all sectors. In this case, the national total is in fact extrapolated, and subsequently split between sectors based on a sector split of nearest year deemed plausible.

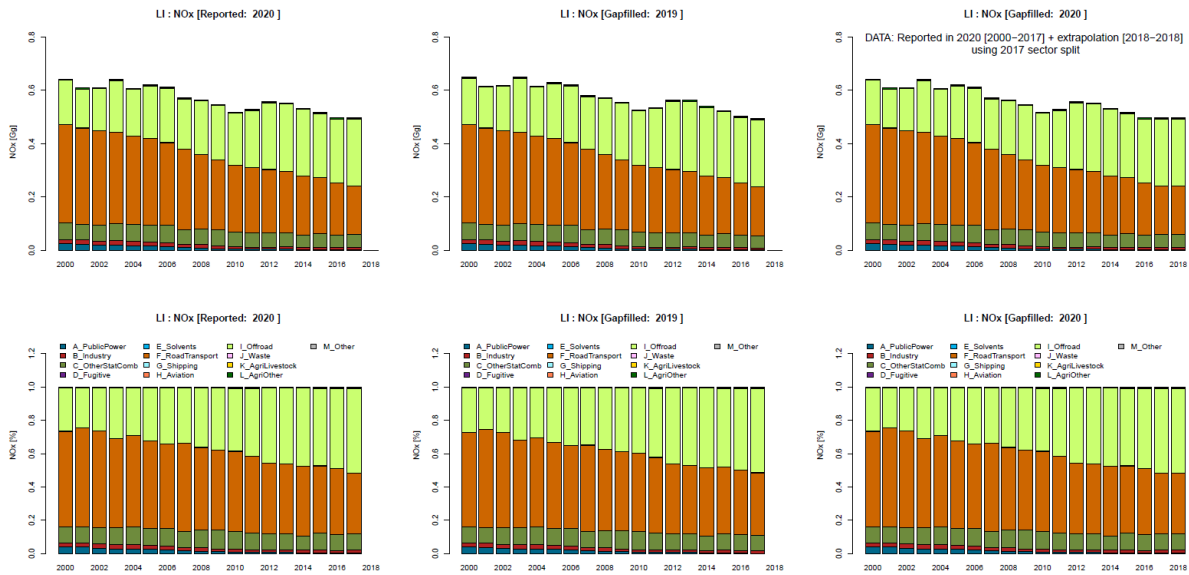

Figure 5: Example of single year Extrapolation (Liechtenstein, NO<sub>x</sub>)

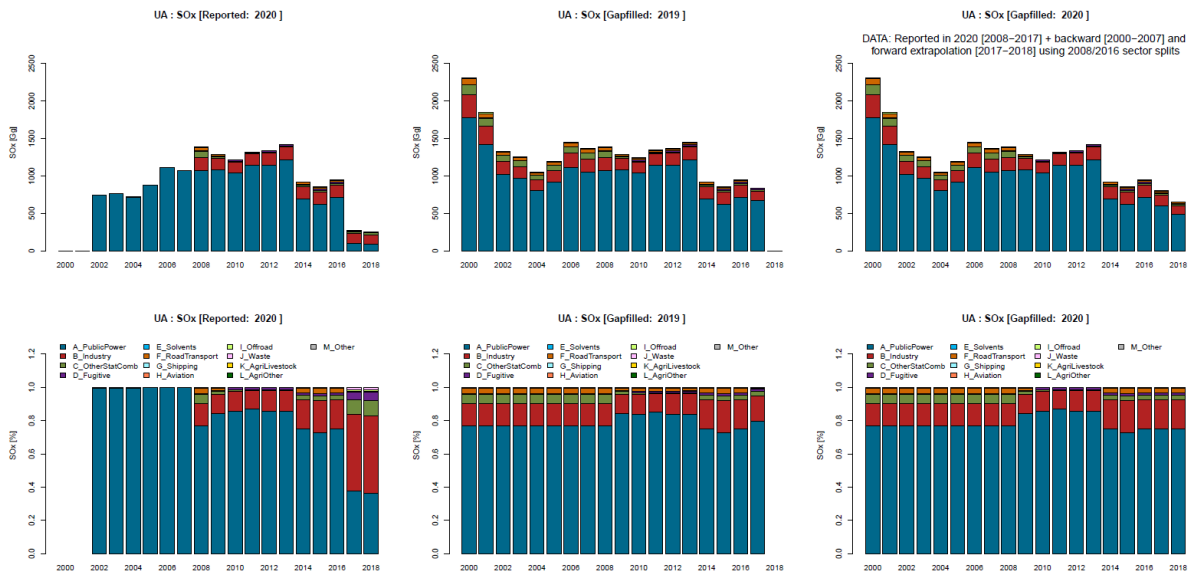

Figure 6: Example of multi-year Extrapolation (Ukraine, SO<sub>x</sub>)

- *Ratio* – where the PM<sub>2.5</sub> emissions are plausible, yet BC has not been reported or appears implausible, this option is considered the most appropriate. For this option, the reported sector PM<sub>2.5</sub> emissions are multiplied by BC fractions (GNFR sector-specific) derived from respective GAINS estimates of PM<sub>2.5</sub> and BC emissions. In most cases, the ratios from the

respective country are taken (Figure 7); however, for small countries which are not resolved by GAINS, another country's BC fractions can be selected (Figure 8). Again this option can be applied to either all sectors or a single sector if e.g. there is mass balance issue for the said GNFR sector.

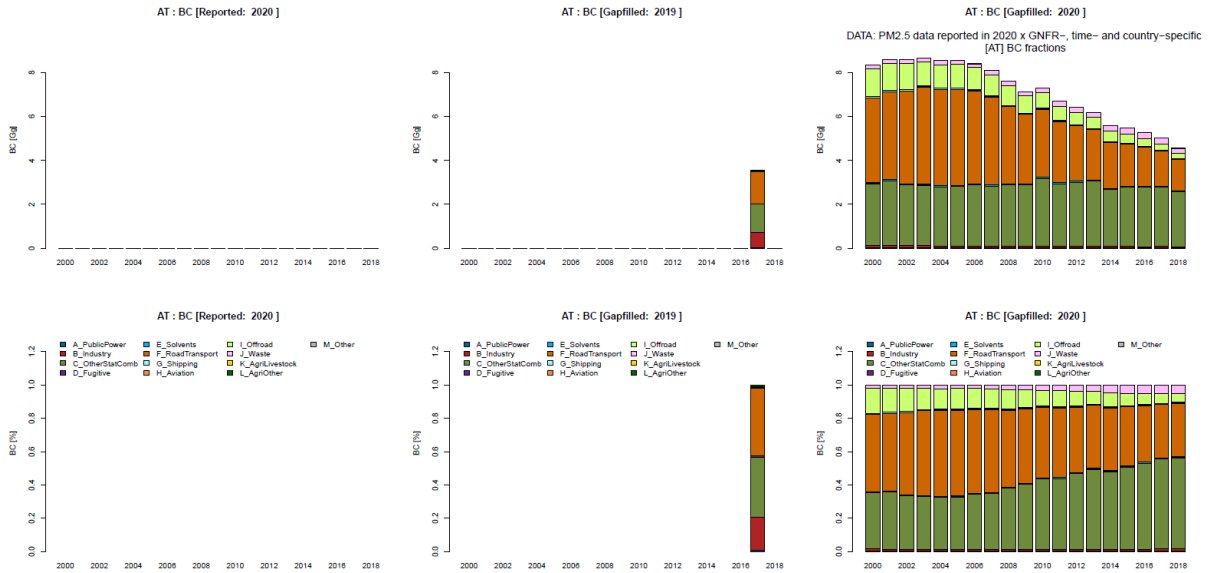

Figure 7: Example of BC gap-filling using reported PM<sub>2.5</sub> emissions and BC fractions from GAINS (Austria)

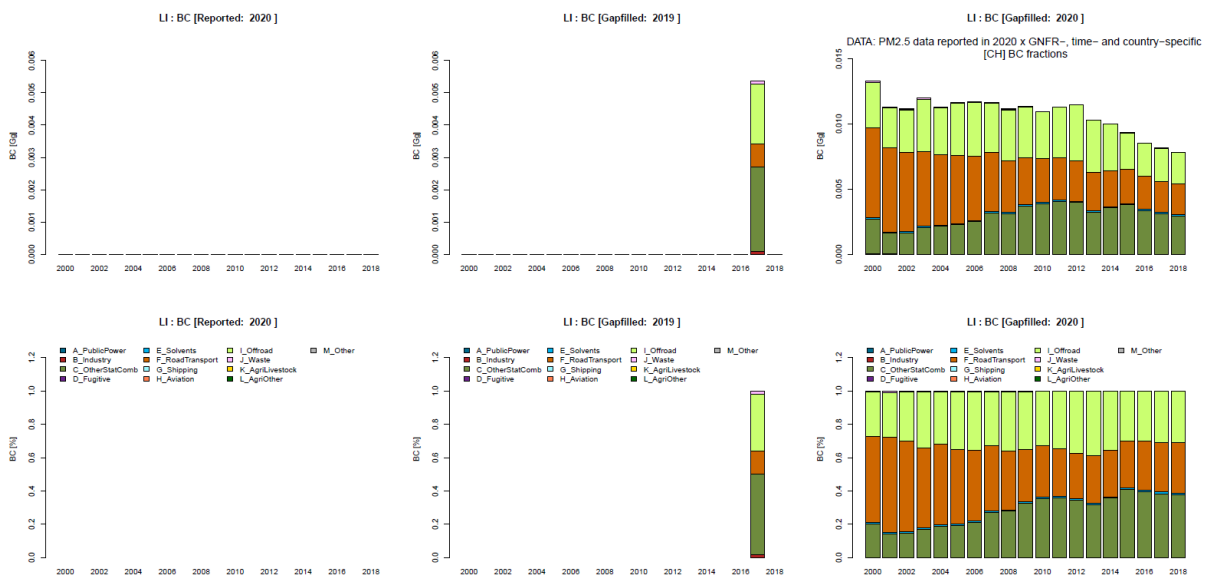

Figure 8: Example of BC gap-filling using reported PM<sub>2.5</sub> emissions and BC fractions from GAINS but from another Country (Liechtenstein using the GAINS BC fractions from Switzerland)

- *Interpolation* – this option can be applied on its own or in combination with the extrapolation methods (Figure 9). In this case missing/improbable emissions for years in between periods of plausible data are simply replaced by linear interpolation.

Figure 9: Example where additional interpolation was required (Belarus, NH<sub>3</sub>)

CEIP experts thus work through a spreadsheet survey summarising the plausibility of the reported emissions, noting missing data and selecting the most appropriate gap-filling option (Figure 10). Once this spreadsheet is complete, a subsequent R routine reads these instructions and implements the gap-filling procedures thus generating a complete EMEP dataset to be gridded.

Before the dataset is finalised, the routine finally corrects for any residual errors (e.g. rounding errors) by replacing all national totals with the respective sum of totals. Any instances where sectoral emissions of PM<sub>2.5</sub> > PM<sub>10</sub> are corrected by replacing the PM<sub>10</sub> emissions with corresponding PM<sub>2.5</sub> emissions. Coupled to this step, the routine calculates the emissions of coarse particulate matter (PM<sub>coarse</sub>) by subtracting sectoral PM<sub>2.5</sub> emissions from the corresponding PM<sub>10</sub> emissions.

A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
CC	Country	Component	Complete time series of NTs	Plausible NTs and source-sector distributions	Gapfilling / Replacement required	Method	Start	End	Sectors	Extrapolation trend	Split	Ratio	Interpolation required	Interpolation years

### 3. Gap-filling 2020

Table A lists all the pollutants and countries for which gap-filling/replacement was required. The Table also details which methods were applied to complete/replace the respective time series.

In addition to this summary, further supplementary documentation of the 2020 quality control and gap-filling is attached to this document as a zip folder containing:

- All quality control graphs for each pollutant of each reporting EMEP country
- The complete spreadsheet survey documenting the expert judgement of plausibility and the selection of the gap-filling methods for each pollutant of each reporting EMEP country
- Output graphs for each pollutant of each reporting EMEP country plotting reported emissions together with the same emissions, gap-filled or replaced emissions which were incorporated into the final EMEP dataset.

Table A: List of Parties and pollutants requiring gap-filling or replacement and the methods applied.

## 4. Data availability and gap-filling method for other regions

For a number of regions in the EMEP domain, emissions are not reported because the countries are not Party to the Convention and/or because only part of their respective territories are included within the EMEP grid. Almost all these emissions are also processed as part of the R routine, where the data are sourced and filled as described below. The emissions from international shipping are however filled as part of separate, subsequent step.

### 4.1. Kazakhstan within the extended EMEP domain (KZE) and outside the extended EMEP domain (KZ)

The final gap-filled emissions for the whole territory of Kazakhstan (KZT) are split between the regions within and outside of the EMEP domain by assuming 15 %: 85 % split between KZ and KZE.

### 4.2. Russian Federation in the extended EMEP domain (RUE): Rest of Russian Federation in the extended EMEP domain (RFE) and EMEP-external part of Russian Federation (RUX).

The partially gap-filled emissions reported by Russia (RU) are estimates for the Russian territory west of the Urals. This however does not cover the complete part of the Russian territory which is within the extended EMEP domain. The emissions of NO<sub>x</sub>, NMVOCs, SO<sub>x</sub>, NH<sub>3</sub>, CO, PM<sub>2.5</sub> and PM<sub>10</sub> from the rest of the Russian Federation in the extended EMEP domain (RFE) were estimated by interpolating between aggregated grid emissions for the area as taken from EDGAR for 2000, 2005 and 2010. The emissions from 2011 onwards were extrapolated based on the respective relative trends of reported national total emissions for RU. Emissions of BC were estimated by multiplying the gap-filled PM<sub>2.5</sub> emissions by the GNFR sector-specific BC fractions as calculated from the GAINS estimates of Russian PM<sub>2.5</sub> and BC emissions. For the EMEP-external part of the Russian Federation (RUX), emissions are calculated in the same fashion.

### 4.3. Turkmenistan (TM) and Uzbekistan (UZ)

Neither Turkmenistan nor Uzbekistan are Party to the Convention and thus do not report national air pollutant emissions inventories. The emissions from these countries are estimated using the estimates from GAINS ECLIPSE v6b. The dataset provides aggregate regional estimates for area *Former USSR (Asia)*, which incorporates Turkmenistan, Uzbekistan and Tajikistan. The emissions for each country are thus estimated by dividing these aggregate regional emissions based on splits derived from national totals of these countries according to the EDGAR dataset. To maintain mass balance of the particulate emissions, PM<sub>10</sub>, PM<sub>2.5</sub> and BC are distributed between the countries based on the relative PM<sub>10</sub> split in EDGAR. The subsequent country emissions are then split between territories within the extended domain EMEP domain and the former official EMEP domain.

#### 4.3.1. Rest of Turkmenistan in the extended EMEP domain (TME) and Turkmenistan in the former official EMEP domain (TMO)

The final gap-filled emissions for the whole territory of Turkmenistan (TM) are split between TME and TMO by assuming a 80 %: 20 % split.

#### **4.3.2. Rest of Uzbekistan in the extended EMEP domain (UZE) and Uzbekistan in the former official EMEP domain (UZO)**

The final gap-filled emissions for the whole territory of Uzbekistan (TM) are split between UZE and UZO by assuming 97 %: 3 % split.

#### **4.4. Sea regions: Atlantic Ocean (ATL), Baltic Sea (BAS), Black Sea (BLS), Caspian Sea (CAS), Mediterranean Sea (MED), North Sea (NOS)**

Emissions from 2000 to 2018 for the sea regions were extracted from CAMS global ship datasets (Finish Meteorological Institute, FMI 2019), provided via ECCAD (<https://eccad.aeris-data.fr> - CAMS\_GLOB\_SHIP, v2.1).

Emissions of BC were estimated by multiplying the gap-filled PM<sub>2.5</sub> emissions by average GNFR sector-specific BC fractions as calculated from the GAINS estimates.

##### Caspian Sea

For the Caspian Sea, FMI shipping data (FMI 2017) for 2015 were used and extrapolated based on the GDP trend of Kazakhstan.

Emissions of BC were estimated by multiplying the gap-filled PM<sub>2.5</sub> emissions by average GNFR sector-specific BC fractions as calculated from the GAINS estimates.

#### **4.5. Aral Lake: Rest of Aral Lake in the extended EMEP domain (ARE), Aral Lake in the former official EMEP domain (ARO)**

For the Aral Lake, inter- and extrapolated data from EDGAR data for 2000, 2005 and 2010 were used. For shipping, FMI shipping data (FMI 2017) for 2015 were used and extrapolated based on the GDP trend of Kazakhstan. Emissions of BC were estimated by multiplying the gap-filled PM<sub>2.5</sub> emissions by average GNFR sector-specific BC fractions as calculated from the GAINS estimates.

#### **4.6. Remaining Asian Areas in the extended EMEP domain (ASE) and Modified Remaining Asian Areas in the former official EMEP domain (ASM)**

To calculate emissions for the remaining Asian Areas in the extended EMEP domain, aggregated and interpolated grid emissions from EDGAR for 2000, 2005 and 2010, extrapolated with the GDP trend for China, were used. Emissions of BC were estimated by multiplying the gap-filled PM<sub>2.5</sub> emissions by average GNFR sector-specific BC fractions as calculated from the GAINS estimates.

#### **4.7. North Africa (NOA)**

To calculate emissions for North Africa, aggregated and interpolated grid emissions from EDGAR for 2000, 2005 and 2010, extrapolated with the GDP trend for Morocco, were used. Emissions of BC were estimated by multiplying the gap-filled PM<sub>2.5</sub> emissions by average GNFR sector-specific BC fractions as calculated from the GAINS estimates.

## Annex I: EMEP Country Codes

AL	Albania	IE	Ireland
AM	Armenia	IS	Iceland
AOE	Arctic Ocean in the extended EMEP domain	IT	Italy
ARE	Rest of Aral Lake in the extended EMEP domain	KG	Kyrgyzstan
ARO	Aral Lake in the former official EMEP domain	KZ	Kazakhstan in the former official EMEP domain (KZ+KZE = KZT)
AST	Asian areas in the extended EMEP domain (ASM+ASE+ARO+ARE+CAS)	KZE	Rest of Kazakhstan in the extended EMEP domain (KZ+KZE = KZT)
AT	Austria	KZT	Kazakhstan (KZ+KZE)
ATL	Remaining North-East Atlantic Ocean	LI	Liechtenstein
ATX	EMEP-external Remaining North-East Atlantic Ocean	LT	Lithuania
AZ	Azerbaijan	LU	Luxembourg
BA	Bosnia and Herzegovina	LV	Latvia
BAS	Baltic Sea	MC	Monaco
BE	Belgium	MD	Republic of Moldova
BG	Bulgaria	ME	Montenegro
BLS	Black Sea	MED	Mediterranean Sea
BY	Belarus	MK	North Macedonia
CA	Canada	MT	Malta
CAS	Caspian Sea	NL	Netherlands
CH	Switzerland	NO	Norway
CY	Cyprus	NOA	North Africa
CZ	Czechia	NOS	North Sea
DE	Germany (FGD+FFR)	PL	Poland
DK	Denmark	PT	Portugal
EE	Estonia	RFE	Rest of Russian Federation in the extended EMEP domain (RUX+RFE = RUE)
ES	Spain	RO	Romania
EU	European Union	RS	Serbia
FFR	Former Federal Republic of Germany (FGD+FFR = DE)	RU	Russian Federation in the former official EMEP domain (RUO+RUP+RUA+RUR = RUE)
FGD	Former German Democratic Republic (FGD+FFR = DE)	RUA	Kaliningrad (RUO+RUP+RUA+RUR = RU)
FI	Finland	RUE	Russian Federation in the extended EMEP domain (RFE+RUX)
FR	France	RUO	Kola & Karelia (RUO+RUP+RUA+RUR = RU)
GB	United Kingdom	RUP	St.Petersburg & Novgorod-Pskov (RUO+RUP+RUA+RUR = RU)
GE	Georgia	RUR	Rest of the Russian Federation (RUO+RUP+RUA+RUR = RU)
GL	Greenland		
GR	Greece		
HR	Croatia		
HU	Hungary		

RUX	EMEP-external part of Russian Federation (RUX+RFE = RUE)	TR	Turkey
SE	Sweden	UA	Ukraine
SI	Slovenia	US	United States
SK	Slovakia	UZ	Uzbekistan (UZO+UZE)
TJ	Tajikistan	UZE	Rest of Uzbekistan in the extended EMEP domain (UZO+UZE = UZ)
TM	Turkmenistan (TMO+TME)	UZO	Uzbekistan in the former official EMEP domain (UZO+UZE = UZ)
TME	Rest of Turkmenistan in the extended EMEP domain (TMO+TME = TM)		
TMO	Turkmenistan in the former official EMEP domain (TMO+TME = TM)		

**Table A 1: Countries of the EMEP West and EMEP East region**

EMEP West countries	AL, AT, BA, BE, BG, CH, CY, CZ, DE, DK, EE, ES, FI, FR, GB, GR, HR, HU, IE, IS, IT, LI, LT, LU, LV, MC, ME, MK, MT, NL, NO, PL, PT, RO, RS, SE, SI, SK
EMEP East countries (9 EECCA countries + TR)	AM, AZ, BY, GE, KG, KZT, MD, RU, TR, UA
Non-EMEP EECCA countries (CLRTAP not ratified)	TJ, TM, UZ
EMEP countries outside the EMEP domain	CA, US

*Note: EECCA = Eastern Europe, Caucasus and Central Asia*

## Annex II: Cross-walk between NFR and GNFR sectors

**Table A 2: Legend explaining the code names of the NFR sectors for source-sector level emissions reporting under the LRTAP Convention and the aggregated GNFR sectors to which they belong**

GNFR Code	NFR Code	NFR Long name	Additional Notes
A_PublicPower	1A1a	Public electricity and heat production	
B_Industry	1A1b	Petroleum refining	
B_Industry	1A1c	Manufacture of solid fuels and other energy industries	
B_Industry	1A2a	Stationary combustion in manufacturing industries and construction: Iron and steel	
B_Industry	1A2b	Stationary combustion in manufacturing industries and construction: Non-ferrous metals	
B_Industry	1A2c	Stationary combustion in manufacturing industries and construction: Chemicals	
B_Industry	1A2d	Stationary combustion in manufacturing industries and construction: Pulp, Paper and Print	
B_Industry	1A2e	Stationary combustion in manufacturing industries and construction: Food processing, beverages and tobacco	
B_Industry	1A2f	Stationary combustion in manufacturing industries and construction: Non-metallic minerals
